Color of the sky at the south pole

Taxonomy of light sources

[Langer and Zucker, CVPR 1997]

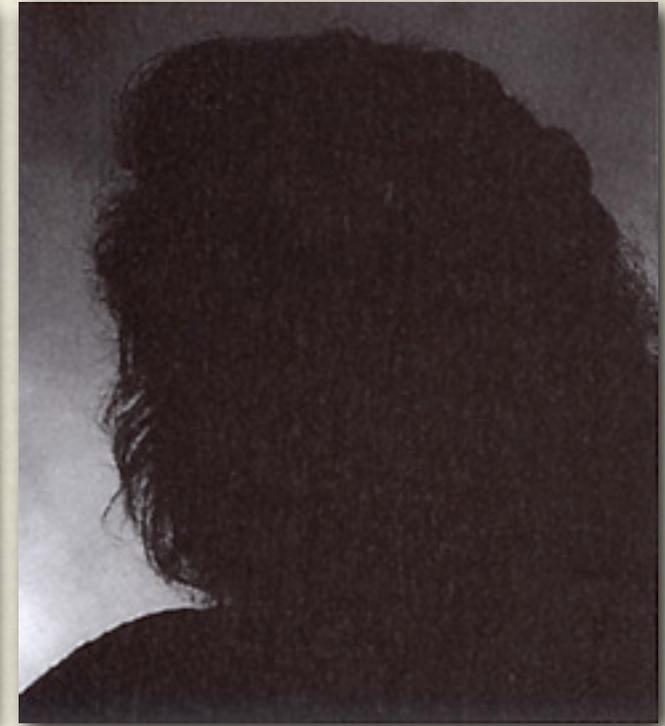

<i>Non-ideal example</i>	<i>Ideal model</i>	h_x	h_y	h_p	h_q	dimension
overcast sky	uniform source	∞	∞	∞	∞	4
Cyberware TM scanner		∞	∞	∞	0	3
		∞	∞	0	∞	
fluorescent tube	linear source	∞	0	∞	∞	3
		0	∞	∞	∞	
sunlight	point source at infinity	∞	∞	0	0	2
	uniform distribution of rays in a plane	∞	0	∞	0	2
		0	∞	0	∞	
louvered linear source (see text)	fan of rays perpendicular to a linear source	∞	0	0	∞	2
		0	∞	∞	0	
small panel light	point source	0	0	∞	∞	2
sunlight through crack in doorway	parallel rays in a plane	∞	0	0	0	1
		0	∞	0	0	
rotating spotlight	fan of rays	0	0	0	∞	1
		0	0	∞	0	
spotlight or laser	single ray	0	0	0	0	0

What's different between these two?

(Hunter & Fuqua)

Basic portrait lighting

main/key

fill

accent/rim

background

(London)

key:fill light ratio

(London)

1:1

2:1

4:1

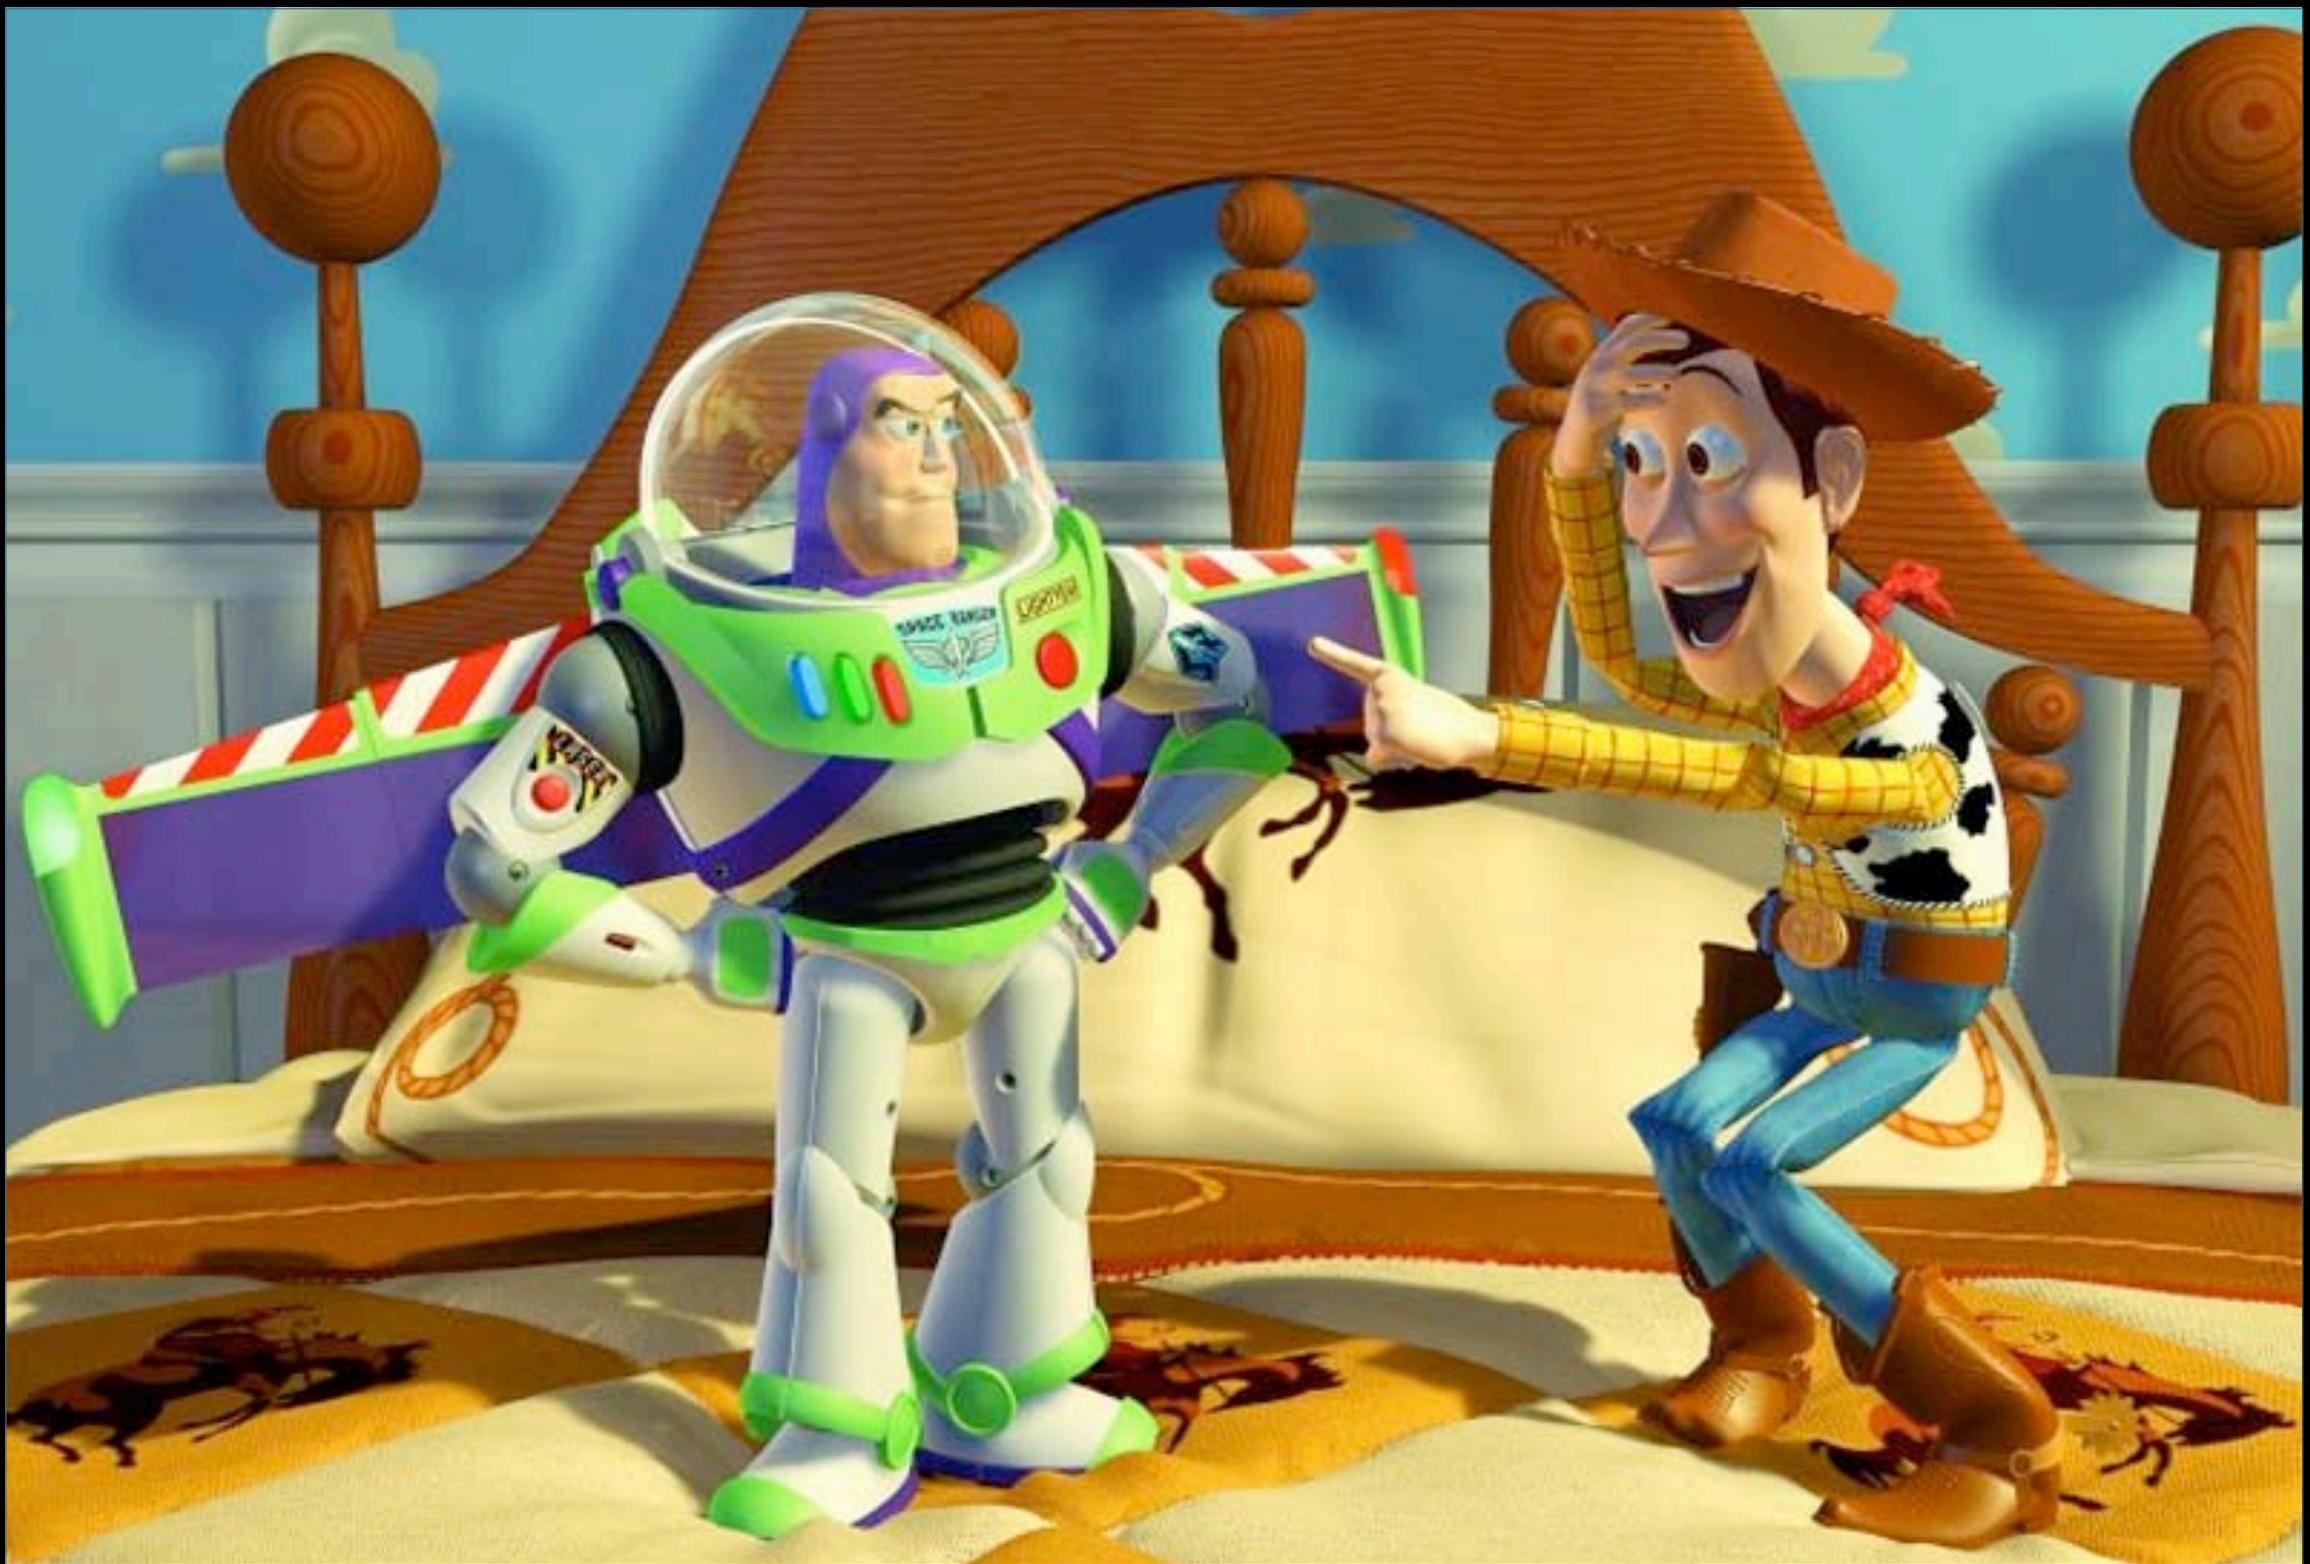

8:1

- ❖ 8:1 means 3 f/stops (3 doublings)
- ❖ think about the mood you want to convey
- ❖ the color of the key and fill lights can be different...

Maxfield Parrish, Daybreak, 1922

Pixar, Toy Story, 1995

Angle of light

(Hunter & Fuqua)

overhead light

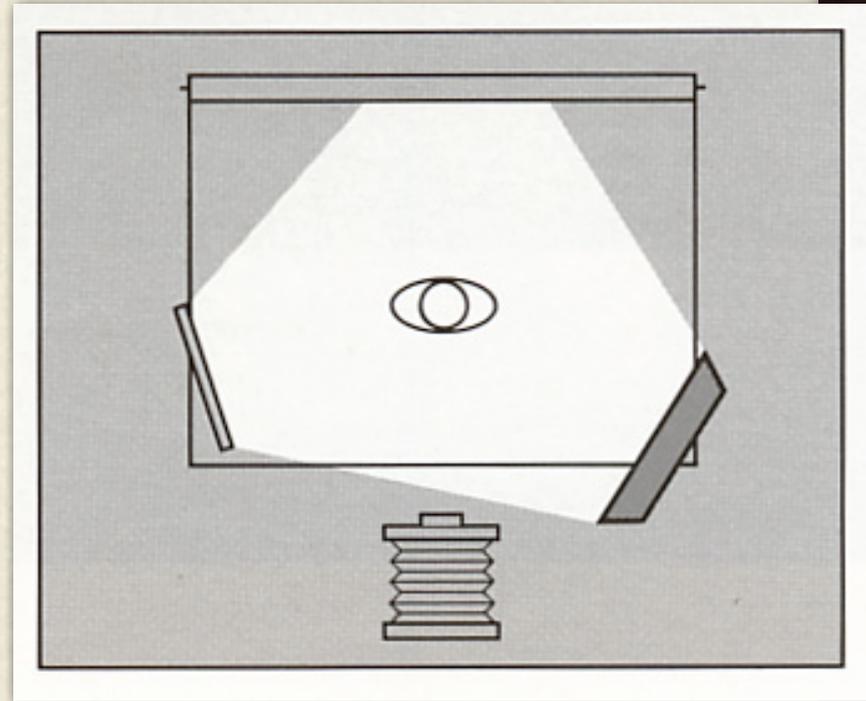

grazing light

darkfield

Light falls off from a point source as $1/d^2$

Luminous intensity of a point light source

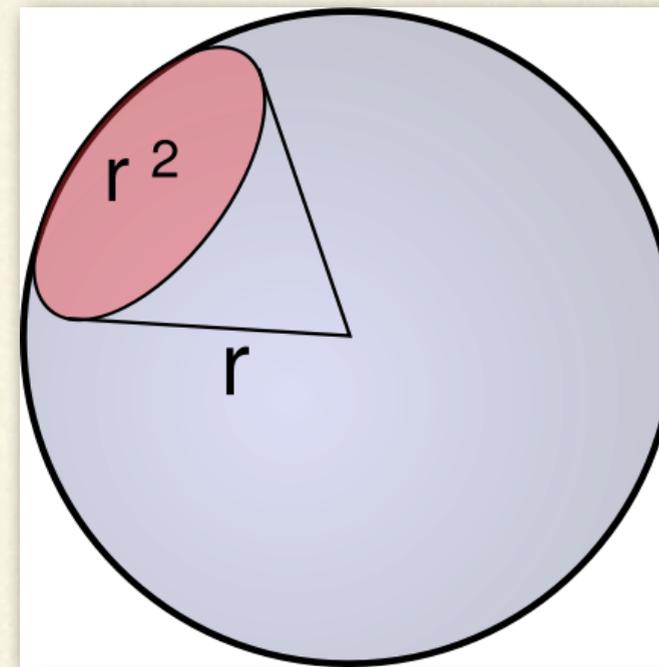

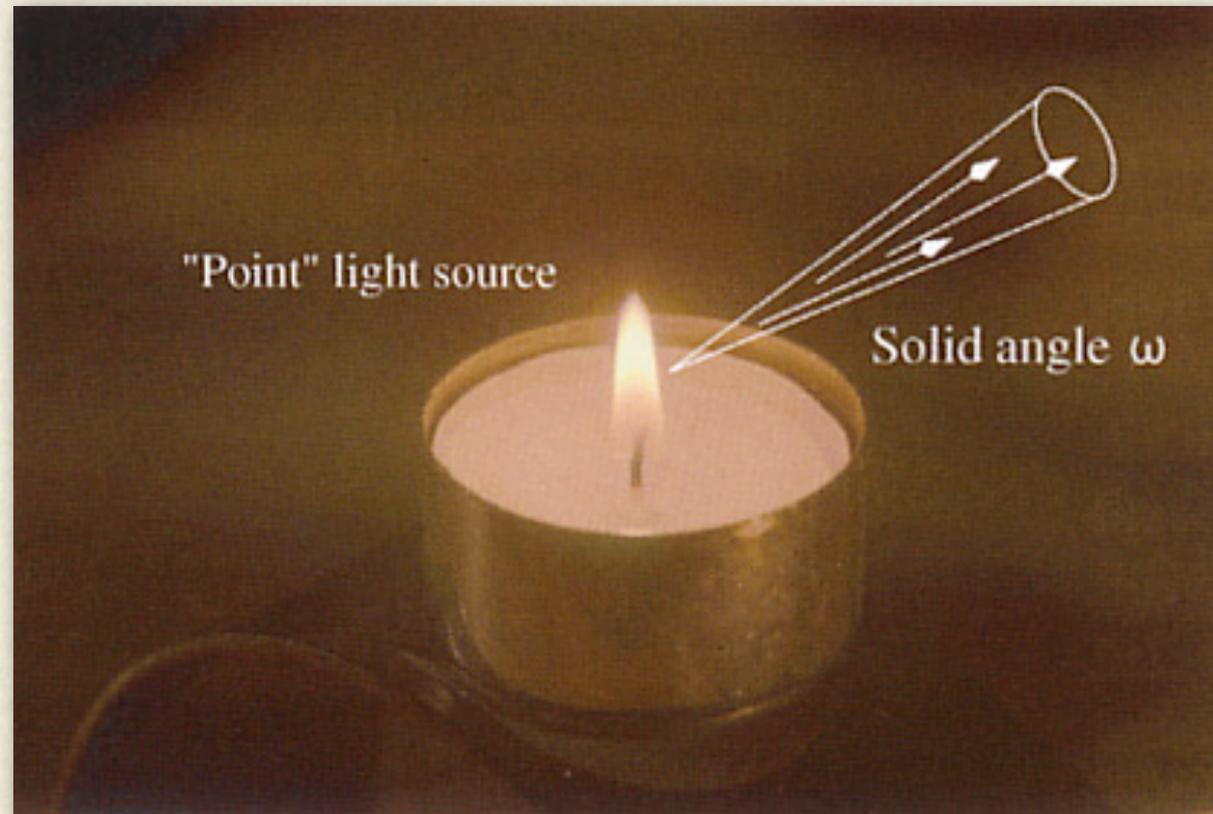

(Reinhard)

❖ $1 \text{ candela} = 1 \text{ lumen} / \text{sr}$

Luminous intensity of a point light source

(Reinhard)

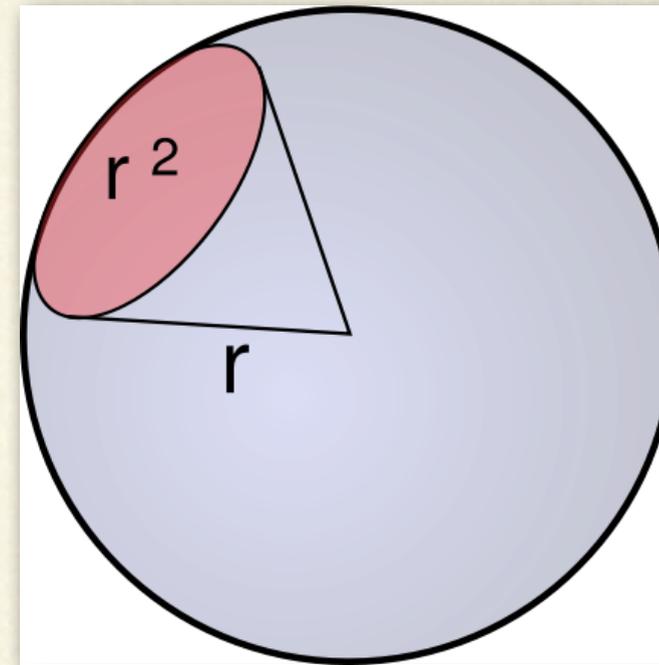

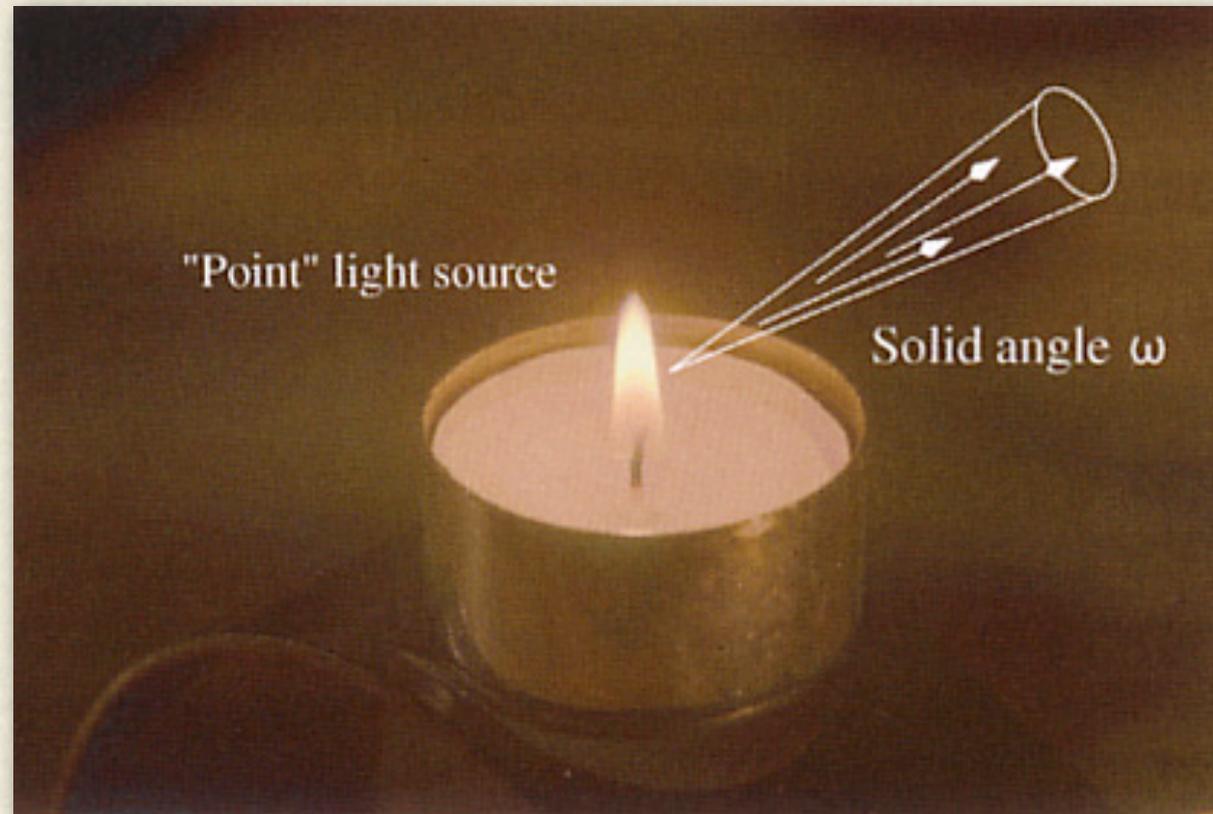

1 steradian (sr)

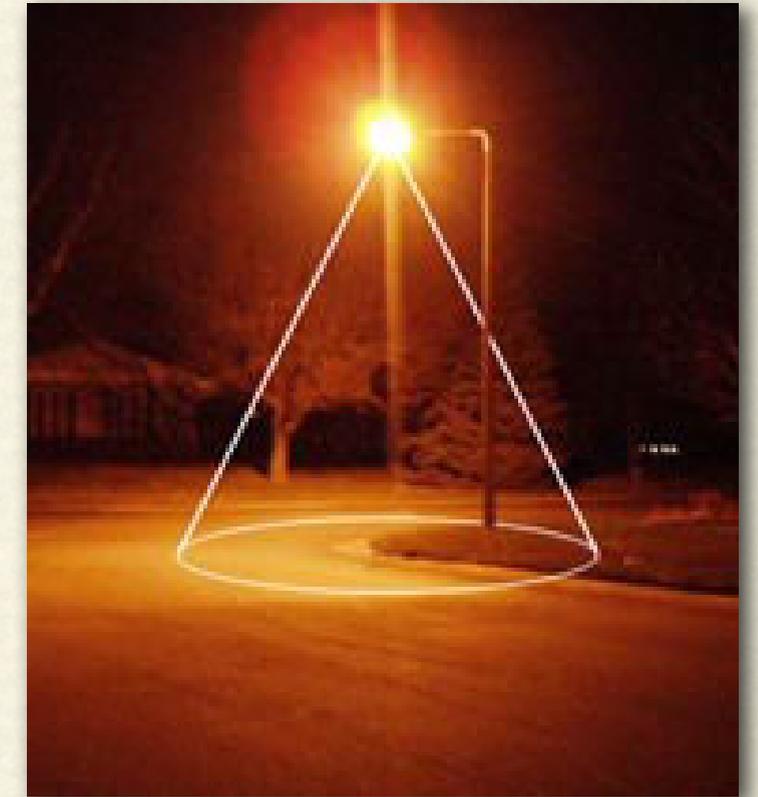

❖ 1 candela = 1 lumen / sr

Luminous intensity of a point light source

(Reinhard)

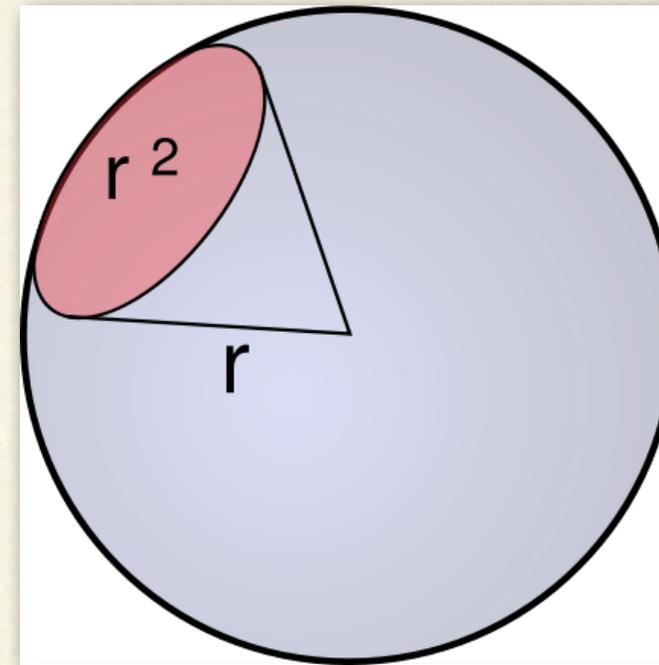

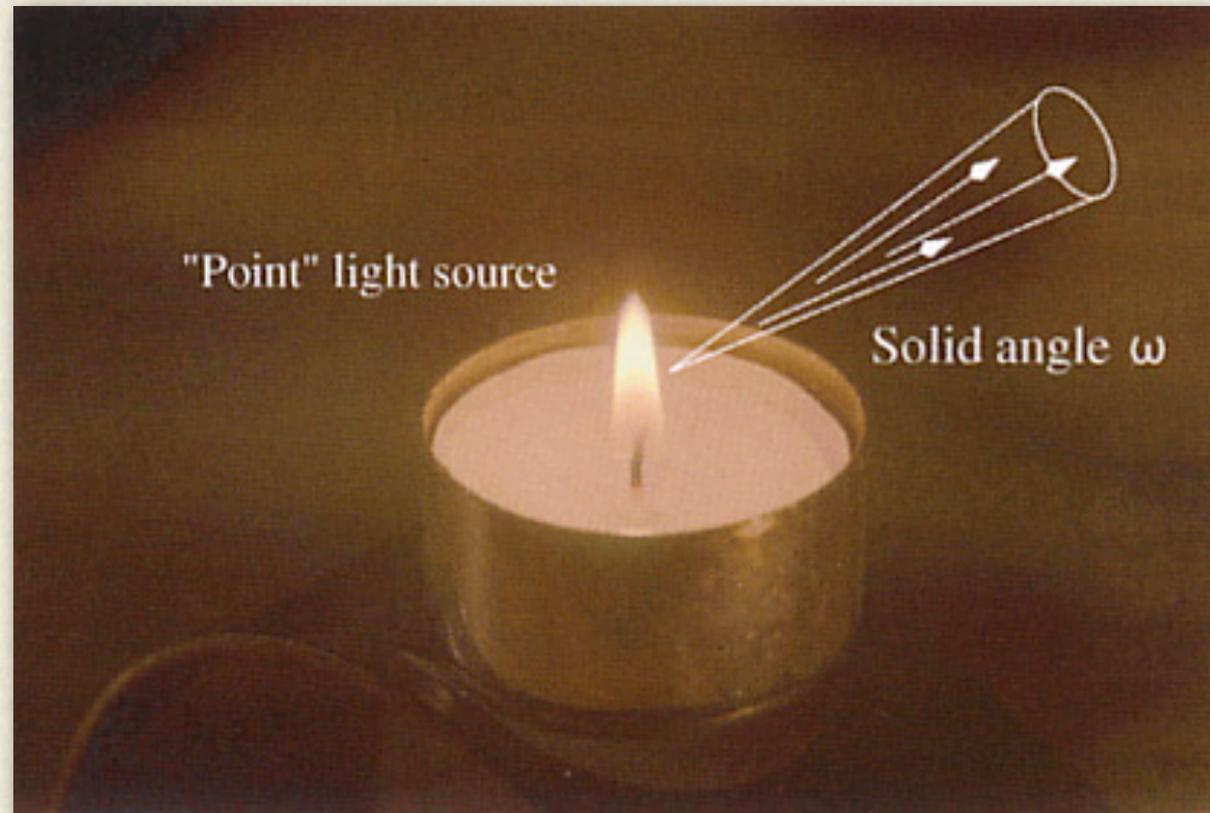

1 steradian (sr)

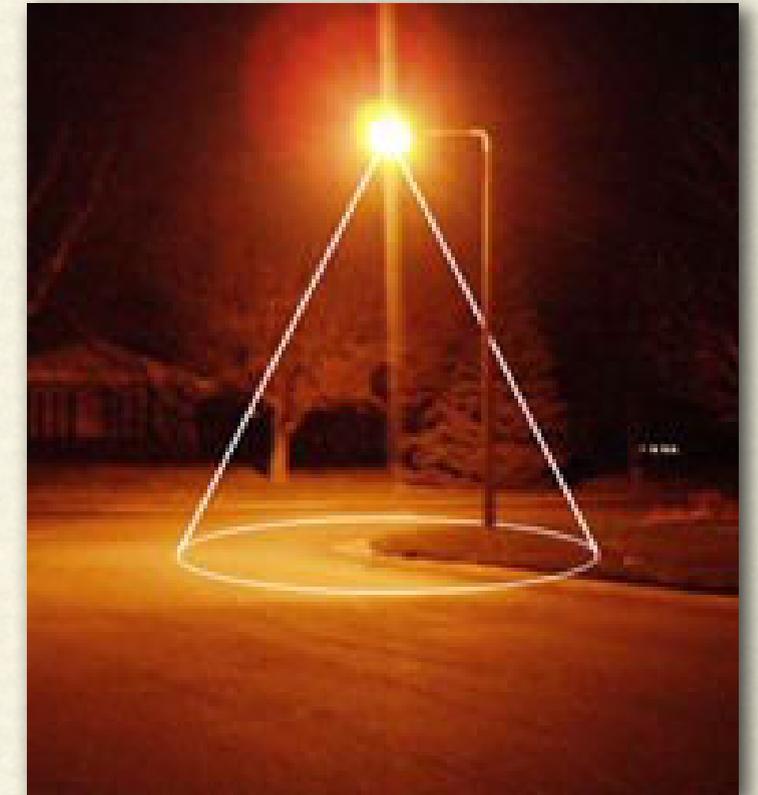

❖ 1 candela = 1 lumen / sr

Luminous intensity of a point light source

(Reinhard)

1 steradian (sr)

- ❖ 1 candela = 1 lumen / sr
- ❖ a standard Bouguer candle gives off 1 candela
- ❖ a 100W light bulb gives off 140 candelas

How does light fall off from an area source?

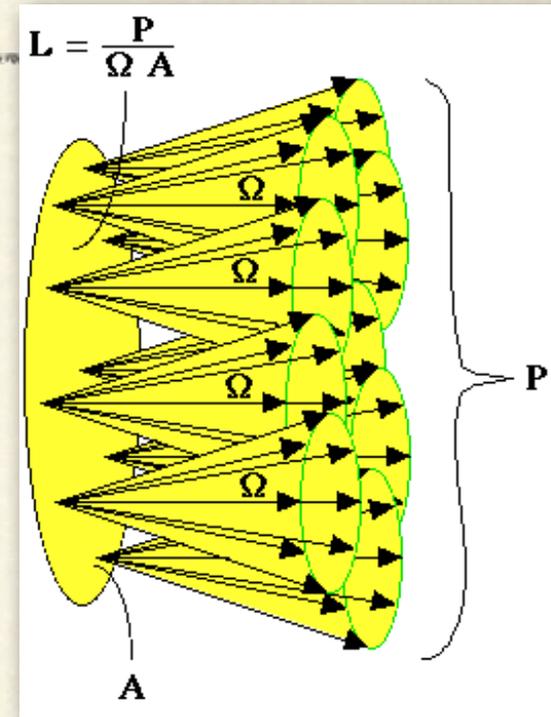

How does light fall off from an area source?

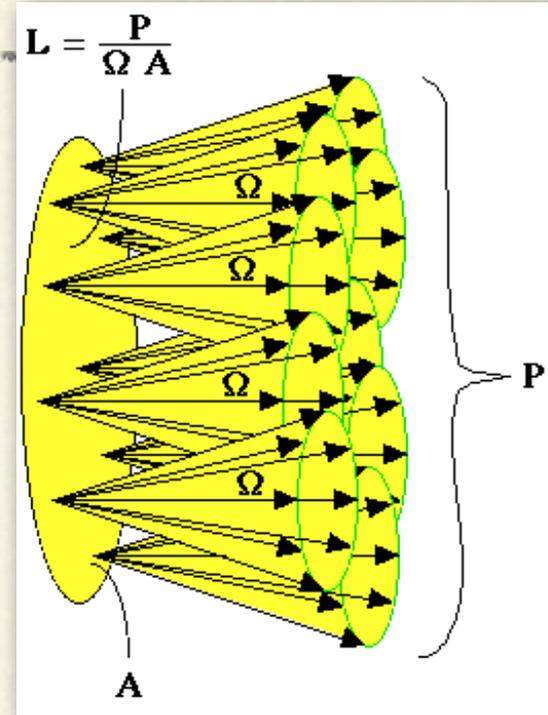

- ❖ the solid angle captured from each point falls as d^2 (left drawing)
- ❖ but the number of points seen by the pixel rises as d^2 (right drawing)
- ❖ these effects cancel, so the illuminance at a pixel is independent of d

Luminance of an area light source

❖ $1 \text{ nit} = 1 \text{ candela} / \text{m}^2 = 1 \text{ lumen} / \text{sr m}^2$

Luminance of an area light source

- ❖ $1 \text{ nit} = 1 \text{ candela} / \text{m}^2 = 1 \text{ lumen} / \text{sr m}^2$
- ❖ luminance arriving on a surface from the (overhead) sun is $160,000 \text{ candelas/cm}^2$
- ❖ luminance reflected by a diffuse white surface illuminated by the sun is 1.6 cd/cm^2
- ❖ reflected by a black surface is 0.04 cd/cm^2
- ❖ arriving from a full overhead moon is 0.3 cd/cm^2
- ❖ luminance arriving from a white cloud is $10 \times$ luminance of the blue sky (a difference of 3.3 f/stops)

Illuminance falling on a surface

(Reinhard)

❖ $1 \text{ lux} = 1 \text{ lumen} / \text{m}^2$

Illuminance falling on a surface

(Reinhard)

- ❖ $1 \text{ lux} = 1 \text{ lumen} / \text{m}^2$
- ❖ British unit is footcandle = 1 candela held 1 foot from surface
(1 footcandle = 10.764 lux)
- ❖ illuminance from a bright star = from a candle 900m away = $1/810,000$ lux
- ❖ illuminance from the full moon = $1/4$ lux

How dark are outdoor shadows?

JPEG file

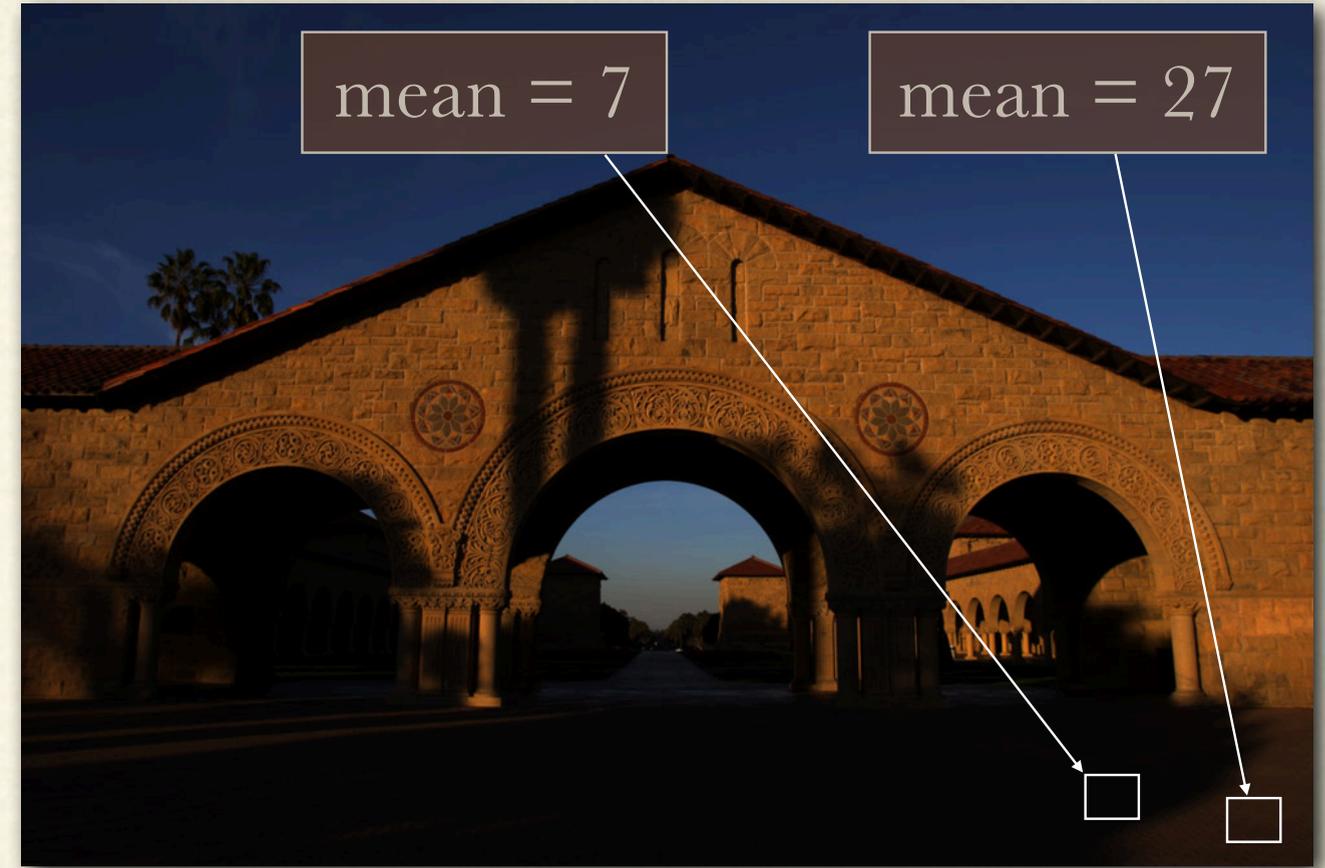

RAW, linearly boosted

- ❖ luminance arriving from the (overhead) sun is $300,000 \times$ luminance arriving from the blue sky, but the sun occupies only a small fraction of the sky
- ❖ illuminance on a sunny day = 80% from the sun + 20% from blue sky, so shadows are $1/5$ as bright as lit areas (2.3 f/stops)

How dark are outdoor shadows?

JPEG file

RAW, linearly boosted

- ❖ luminance arriving from the (overhead) sun is $300,000 \times$ luminance arriving from the blue sky, but the sun occupies only a small fraction of the sky
- ❖ illuminance on a sunny day = 80% from the sun + 20% from blue sky, so shadows are $1/5$ as bright as lit areas (2.3 f/stops)
